

"AIR-AID"

for your Helio Engraving Machine

New Item
from Japan

Designed to your pet peeves by SYNTEK

Vacuum Nozzle

Vacuuming copper dusts during engraving

Burr Cutter

Removing burrs around cell structures

Diamond Stylus

Engraving millions of "cells" on cylinder

Sliding Shoe

Arranging distance between cylinder and stylus

*You see top part only

Helio Engraving Head

Question...

How much copper dusts your engraving heads have?

If you have a lot, there is a possibility that those burrs

make scratches or pin-holes on surface of cylinder.

Burrs may heat up easily by friction of rotating cylinder.

It brings you high level of stress...

Why do your heads remain much copper burrs???

Reason is vacuum nozzle does not have suction strength.

Practical solution is very simple...

Just use "AIR-AID"!!

Clean your engraving head from top to bottom!

Original
Nozzle

AIR-AID

Suction opening is "**smaller**" than original nozzle.
Means its suction power is stronger than original one.

*We estimate 20 to 23% more powerful!

Original
Nozzle

AIR-AID

Distant to each engraving tool is "**closer**" than original.
Means its vacuum amount is more than original one.

Original
Nozzle

AIR-AID

After engraving, "**much less**" copper burrs.

The place that got cleaned feels good and less trouble.

*We estimate 90% more cleaner than original one.

Cleanliness is the next to Godliness.
A new **AIR-AID** sweeps clean.
